

Resco Routes

Wherever the job takes you

Efficient route planning for your mobile workforce

How it works

Use the **Location Monitor** to keep track of your team's progress and to respond to the situation in the field

Plan work assignments with the fully interactive **Schedule Board**

Field reps receive assignments in their **mobile app**. They can also use it to plan routes and manage their work travel.

Location Monitor

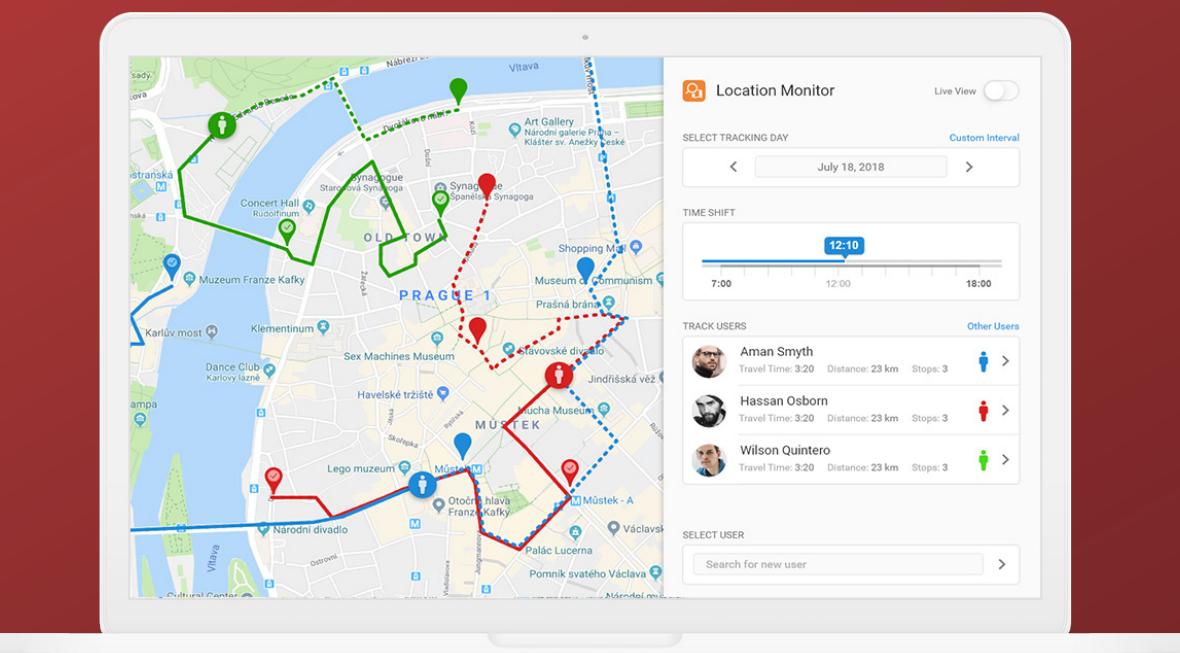

Keep up with your staff in real time

Follow your team's progress on a map view with real-time positions. By leveraging location data, you can discover potential problems and make quicker and informed decisions.

Look into the past or future

The Time Shift feature allows you to check past locations and activities and also, based on current and past data, future predictions. This way you can see if anyone will be finishing sooner than expected and can take on another assignment to help the team.

Schedule Board

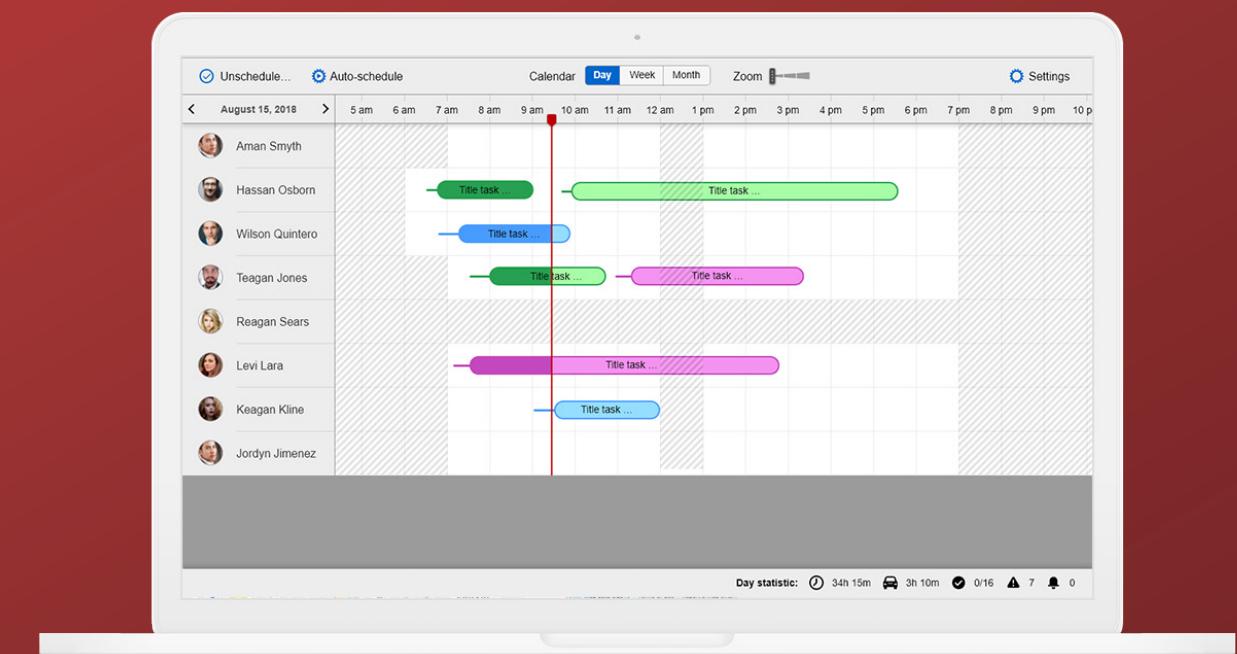

All your operations in one place

Do you keep customer data, orders, or job assignments in one place, but then schedule work in spreadsheets or shared calendars? Unify your processes and manage your field tasks within the same solution.

Fast and effective planning

Use drag-and-drop, rules and auto-scheduling to save time on planning. Multi-user scheduling is also possible, meaning multiple managers or team leads can schedule appointments for multiple field workers simultaneously.

Resco Routes mobile app

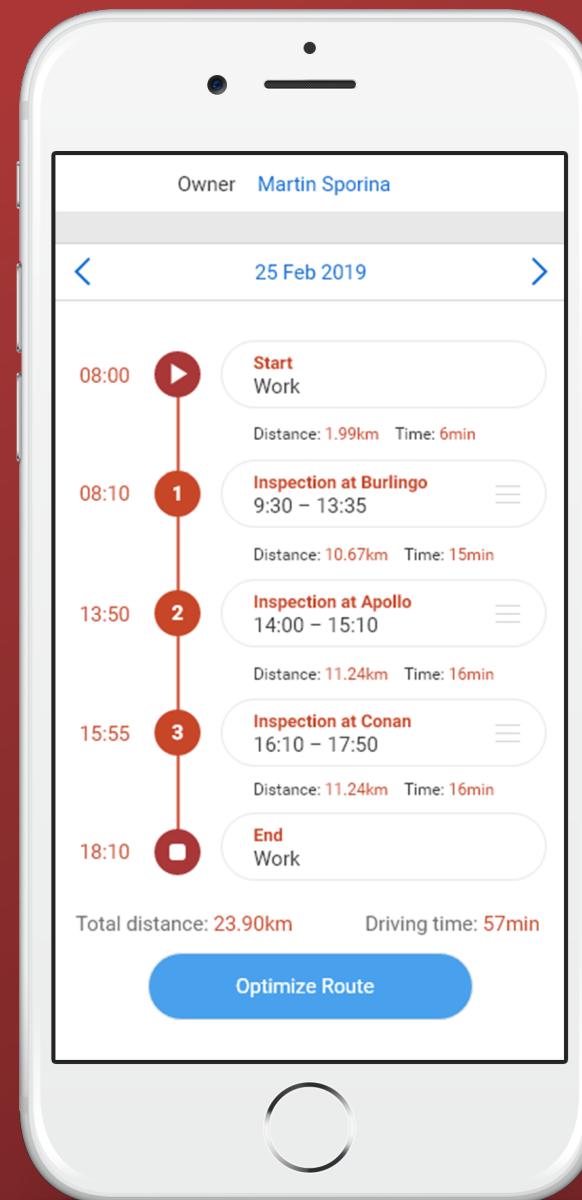

Personal route planner and more

The multi-platform app allows users to view their assignments, plan routes, navigate to a site, track time, and manage their timesheets. This way, they can get planning and reporting out of the way and focus on the job well done.

GPS tracking without any additional hardware

The app sends location data in the background even, when it's not active. By using mobile devices to send location information, you don't have to equip your vehicles with additional trackers.

FAQ

Can I connect Resco Routes to my backend?

Resco Routes can be natively integrated with Microsoft Dynamics 365/CRM, enabling you to use your Accounts, Contacts, Appointments and other entities. An API for 3rd party integration is also available.

Can I combine Resco Routes with other Resco products? And if I do, how will it help me and my team?

Resco Routes can be used as an add-on with other Resco products. Does your team already profit from Resco's offline mobility while gathering leads, completing work orders, or performing inspections? Then you can extend the solution to also monitor and visualize their location. You can use this information to respond to a situation in real-time. And, by looking back and analyzing past data, you can also improve future planning so that more assignments are finished on time and you can meet your customers' expectations.

Can I customize the app and add my own branding and/or functionality?

You can customize the app using the Woodford configuration tool. You can change the color theme, upload your logo, display custom views and even add your own functionality with JavaScript, which is perfect for businesses with custom processes, that would like to have an all-in-one app.

How do you protect the end user's privacy?

The Resco Routes mobile app can be set to only collect and send location data during working hours, ensuring the device holder's privacy.
